Developer Rubrics

Criteria	Exemplary (4 pts)	Proficient (3 pts)	Developing (2 pts)	Needs Improvement (1 pt)	Score
1. Local Testing & Verification	Rigorously pulls PR branches locally, verifies features against requirements, and checks edge cases.	Tests core functionality locally against standard expected inputs.	Performs superficial testing; only checks happy paths without testing edge cases.	Skips local testing entirely, passing broken or untested code into production.	__ / 4
2. Detailed Bug Reporting	Logs detailed bug reports on GitHub Issues with clear steps to reproduce, expected vs. actual results, and logs.	Reports bugs clearly with basic descriptions of what failed.	Logs vague bug reports lacking steps to reproduce, logs, or screenshots.	Does not log bugs in GitHub Issues; communicates bugs informally or ignores them.	__ / 4
3. PR Review Timeliness	Reviews assigned PRs within 24 hours to prevent development bottlenecks.	Reviews PRs within a reasonable timeframe (24–48 hours).	Takes a long time to review PRs, stalling the team's weekly workflow.	Completely ignores review requests or delays them past the sprint deadline.	__ / 4
4. Review Depth & Feedback	Provides constructive, inline PR feedback on code logic, performance, security, and UI/UX.	Leaves useful feedback or suggestions on code behavior and functionality.	Gives brief or superficial comments without digging into the underlying logic.	Approves PRs blindly without reading or checking the code logic.	__ / 4
5. Regression Testing & Sign-off	Verifies fixed bugs do not break existing features and maintains a weekly QA test summary.	Re-tests bug fixes to confirm they work before giving final merge approval.	Tests bug fixes loosely without verifying whether existing features still work.	Approves PR merges with known outstanding bugs or without re-testing fixes.	__ / 4

Note:

- If a developer pushes a code. They need to push it in a branch and initiate a pull request for QA approval and testing.
- Developers are not recommended to push the code in one go. Strictly, no code dumping in the repository.

Developer Rubrics

- Any Redundant changes to the repository will not be counted as an activity.
